

CLAIMS

1. A display device comprising:
 - a display part; and
 - a base part supporting the display part,said base part comprising:
 - a tilt unit to mount the display part thereon for rotation about a first axis;
 - a first member directly or indirectly supporting the tilt unit;
 - a second member disposed in a facing relationship with the first member;
 - a guide part provided on one of the first member and the second member for guiding the first member and the second member for relative rotation therebetween about a second axis different from the first axis; and
 - at least one low friction member disposed between the first member and the second member.
2. The display device according to claim 1, further comprising a cover having an aperture, wherein the tilt unit is fixed to the first member through the aperture of the cover, and the first member is disposed between the cover and the second member.
3. The display device according to claim 1, further comprising a cover, wherein the tilt unit is fixed to the cover, the cover being directly or indirectly fixed to the first member, the first member being disposed between the cover and the second member.
4. The display device according to claim 1, wherein said at least one low friction member comprises a plurality of low friction members, the plurality of low friction members being held on one of the first member and the second member and slidable with respect to the other of the first member and the second member.
5. The display device according to claim 3, wherein the low friction member comprises one of a ball-shaped member and a mushroom-shaped member.
